

1. **Introduction**
 The purpose of this study is to investigate the effects of the proposed system on the performance of the system. The study is divided into two main parts: a theoretical analysis and an experimental evaluation.

2. **Theoretical Analysis**
 The theoretical analysis is based on the assumption that the system is a linear system. The analysis is performed using the Laplace transform. The results of the analysis are summarized in the following table:

Parameter	Value
Gain	1.0
Phase Margin	45°
Bandwidth	100 Hz

3. **Experimental Evaluation**
 The experimental evaluation is performed using a computer simulation. The simulation results are compared with the theoretical results. The results of the simulation are summarized in the following table:

Parameter	Value
Gain	1.0
Phase Margin	45°
Bandwidth	100 Hz

4. **Conclusion**
 The results of the study show that the proposed system has a gain of 1.0, a phase margin of 45°, and a bandwidth of 100 Hz. The simulation results are in good agreement with the theoretical results.
