

1. **Introduction**
 The purpose of this study is to investigate the effects of the proposed system on the performance of the system. The study is divided into two main parts: a theoretical analysis and an experimental evaluation.

2. **Theoretical Analysis**
 The theoretical analysis is based on the assumption that the system is a linear system. The analysis is performed using the Laplace transform. The results of the analysis show that the system is stable and that the proposed system has a higher bandwidth than the existing system.

3. **Experimental Evaluation**
 The experimental evaluation is performed using a computer simulation. The simulation results show that the proposed system has a higher bandwidth than the existing system. The results also show that the proposed system has a lower error rate than the existing system.

4. **Conclusion**
 The results of the study show that the proposed system is a viable alternative to the existing system. The proposed system has a higher bandwidth and a lower error rate than the existing system.
