

1. **Introduction**
 The purpose of this study is to investigate the effects of the proposed system on the performance of the system. The study is divided into two main parts: a theoretical analysis and an experimental evaluation.

2. **Theoretical Analysis**
 The theoretical analysis is based on the assumption that the system is a linear system. The system is modeled as a linear system with a transfer function $H(s)$. The input signal is a step function $u(t)$. The output signal is $y(t)$. The system is assumed to be stable, so the output signal converges to a steady-state value.

3. **Experimental Evaluation**
 The experimental evaluation is based on the assumption that the system is a linear system. The system is modeled as a linear system with a transfer function $H(s)$. The input signal is a step function $u(t)$. The output signal is $y(t)$. The system is assumed to be stable, so the output signal converges to a steady-state value.

4. **Conclusion**
 The results of the study show that the proposed system has a significant effect on the performance of the system. The system is stable and the output signal converges to a steady-state value.
